
Assimilation of the reflectivity (and ZDR column) with the OSSE system

Kobra Khosravian

24-26 July 2024

SPP 2115 PROM all-hands meeting

Leipzig

What is Observational System Simulation Experiments (OSSE) ?

OSSE is an assimilation experiment where instead of real observations, synthetic observations are used.

What is Observational System Simulation Experiments (OSSE) ?

OSSE is an assimilation experiment where instead of real observations, synthetic observations are used.

- **Synthetic observations** are calculated by applying a forward operator to a so-called nature run.

What is Observational System Simulation Experiments (OSSE) ?

OSSE is an assimilation experiment where instead of real observations, synthetic observations are used.

- **Synthetic observations** are calculated by applying a forward operator to a so-called nature run.
- **Nature run**: a model run without data assimilation.

What is Observational System Simulation Experiments (OSSE) ?

OSSE is an assimilation experiment where instead of real observations, synthetic observations are used.

- **Synthetic observations** are calculated by applying a forward operator to a so-called nature run.
- **Nature run**: a model run without data assimilation.

- Poor quality of polarimetric radar parameters (here ZDR) measurements.

- Poor quality of polarimetric radar parameters (here Z_{DR}) measurements.
- Pretty large discrepancy between simulated Z_{DR} from model (here the EMVORADO) and the real observation particularly above the melting layer .

- Poor quality of polarimetric radar parameters (here Z_{DR}) measurements.
- Pretty large discrepancy between simulated Z_{DR} from model (here the EMVORADO) and the real observation particularly above the melting layer .
- OSSE provides insight into the abilities and weaknesses of a defined assimilation system (e.g., Z_{DR} column defined as an object) due to using a perfect model.

- Poor quality of polarimetric radar parameters (here Z_{DR}) measurements.
- Pretty large discrepancy between simulated Z_{DR} from model (here the EMVORADO) and the real observation particularly above the melting layer .
- OSSE provides insight into the abilities and weaknesses of a defined assimilation system (e.g., Z_{DR} column defined as an object) due to using a perfect model.
- Allows for high control over various settings and parameters within the data assimilation system.

20 May 2022

- ❖ The nature run:
 - Started from 07 UTC and had 6 pre-run before using the simulated reflectivity to make the synthetic observation.
 - The initial data came from a 2-mom experiment
 - boundary condition from ICON-EU

20 May 2022

- ❖ The nature run:
 - Started from 07 UTC and had **6 pre-run** before using the simulated reflectivity to make the synthetic observation.
 - The initial data came from a 2-mom experiment
 - boundary condition from ICON-EU

- ❖ The assimilation run:
 - The initial data came from **the same 2-mom experiment**
 - **The same boundary condition** as the nature run

Example of preparing the initial data (Increase the ensemble spread)

- Prepare the initial data to ensure sufficient ensemble spread.
 - How do we increase the ensemble spread? By running the model for 7 hours without assimilation.

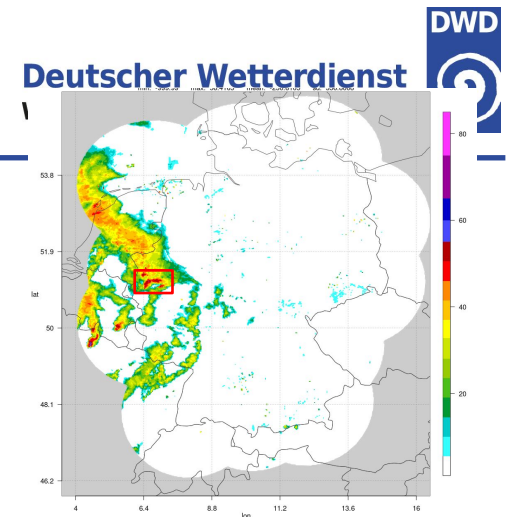

Example of preparing the initial data (Increase the ensemble spread)

- ❖ The OSSE works well for radar reflectivity, as expected.

- ❖ The OSSE works well for radar reflectivity, as expected.

Next Steps:

- ❖ The ZDR should be defined in the same way as the reflectivity composite for the entire German radar network (over the model grid or radar grid points).
 - Detect the ZDR column.
 - Define the ZDR column as a new observation object within the assimilation system.

Thank you for your attention
